## What Does My Radiator Do?

---

Automobile engines generate extreme amounts of heat. If that heat stayed entirely within the engine block, it would start to wear down the metal making up the individual engine components. ***Radiators disperse this heat into the outside air, keeping your engine running at a safe temperature.*** This happens by having coolant flow around various parts of the engine and then back into the radiator core, which is the large tank-like feature at the very front of your car. ***Your radiator also has a fan that turns on and off when needed, usually when your car is either moving very slowly, or it is in the park with the engine running.*** The fan keeps air flowing through the core, continually lowering the temperature of the coolant before it heads back into the engine block.

---

One of the most common problems in engine cooling systems is a radiator leak.

When this occurs, there may not be enough coolant in the system to keep your engine running at a safe

temperature (around 200F for most vehicles). ***If the radiator itself is leaking, you will almost always need professional help,*** but if the

leak is through a hose, someone with automotive knowledge may be able to find a replacement and swap the leaky

hose out themselves. Other common problems include a faulty thermostat, which regulates when coolant is released into the engine, and a broken fan, which will need to be replaced, but you would be safe driving for a short time as long as the engine did not idle very much.

A few of the easier fixes include:

- Refilling coolant
- Flushing the radiator
- Replacing leaking hoses
- Switching out the pump

***Refilling a coolant system generally does not take very long and will always need to be done if the air is suspected to have gotten into the system.*** If the coolant is low due to a hose leak, those issues can usually be taken care of within a few hours, especially with newer cars, which are usually easier to repair thanks to the availability of standard parts. ***If your pump is broken, it will need to be replaced immediately,*** but it is a relatively inexpensive fix and if a part is nearby, it can be done within a day or two.

## **Car Radiator Repair Service FAQs**

---

At Ace Auto Utah, we want to make sure that all of your questions are answered before you decide to partner with our services. Some of the most common questions that we get asked include:

### **What Are Some Common Radiator Problems?**

---
